*U.S. EPA Validated Sediment Sampling Results (10/27/00 - 11/3/00) from
the Mississippi River at the Solutia Facility Located in Sauget, IL* 150798

- The Mississippi River sediments are mainly fine and coarse sands, with fine sand sediments generally occurring within 100' of the riverbank and coarse sand found greater than 100' from the bank. Along the southern half of Site R, there is a finer silt area located between the fine and coarse sands, apparently associated with a man-made underwater structure that allows for deposition of fines.
- Higher levels of total organic carbon (TOC) are associated with the fine sands and silts located near the riverbank. TOC is very low (<120 ppm) in the coarse sands.
- The areal extent of contaminated sediments in the Mississippi River generally begins upstream near the northern boundary of Site R and extends downstream beyond the southern boundary of Site R. Contaminated sediments are generally found within 150' of the riverbank but extend greater than 300' from the riverbank in the vicinity of the silt deposits at the southern-half of Site R.
- The areal extent of contaminated sediments is best defined by the presence of elevated concentrations of chlorobenzene at twelve sediment sample locations and to a lesser extent, 4-chloroaniline and benzene found at seven and six sediment sample locations.
- Elevated concentrations of aniline, dichlorobenzenes, PCBs, and Δ-BHC are also present in three to five sediment sample locations.
- Elevated concentrations of 1,2-dichloroethane, toluene, methoxychlor, 2,4-D, chlorobenzilate, 4,4'-DDD, bis(2-ethylhexyl)phthalate, 3-methylphenol, 2-chlorophenol, 2,4-dichlorophenol, phenol, ethylbenzene, and xylenes were also present in one or two sediment sample locations.
- None of the hazardous constituents listed above were found in any significant concentration at the upstream sample. All the hazardous constituents found in sediments appear to be associated with the groundwater discharge plume in the vicinity of Site R.
- Region 5 Ecological Data Quality Levels (EDQLs) for detected hazardous constituents are exceeded at a total of eleven of the twenty-one (52%) sediment sample locations. The number of sample locations exceeding EDQLs for specific hazardous constituents are:

*U.S. EPA Validated Sediment Sampling Results (10/27/00 - 11/3/00) from
the Mississippi River at the Solutia Facility Located in Sauget, IL*

- From north to south, the sediment sample locations that have concentrations of hazardous constituents exceeding EDQLs are SD-2-150, PDA-8-60, SD-3-99, PDA-5-60, SD-4-90, SD-5-75, SD-5-150, SD-5-315, PDA-2-60, SD-6-90, and SD-7-150 (see figure). These sample locations correspond to the northern boundary of Site R and beyond the southern boundary of Site R.
- Neither of the two far downstream samples (SD-8-57 and SD-9-51) had concentrations of hazardous constituents exceeding EDQLs (see figure).
- The inner core of contaminated sediments (>10 ppm total organics) is found at PDA-5-60, PDA-2-60, and SD-5-150 with an outer core of contaminated sediments (>1 ppm total organics) found at SD-2-150, PDA-8-60, SD-5-75, SD-5-315, and SD-7-150. The outer core is consistent with the Site R boundary and the inner core is consistent with the southern-half of Site R, approximately 60' to 150' from the riverbank.
- The detection limits for hazardous constituents are highly elevated at sample locations PDA-5-60, PDA-2-60, and SD-5-150 due to the presence of significant contamination.
